

Efficient Document Conversion in the Browser

Jane Doe, John Smith

Abstract

Converting documents between formats is a common task. Existing tools often require uploading files to a remote server, which raises privacy concerns. In this paper we present a client-side approach that performs all conversions inside the web browser using WebAssembly. Our evaluation shows that the approach preserves layout, tables and images with high fidelity while keeping user data private.

1 Introduction

2 Method

We compare three engines on a corpus of 120 documents. Table 1 summarises the results.

Engine	Accuracy
Baseline	71.2%
Ours (fast)	88.5%
Ours (full)	94.3%

Table 1: Conversion accuracy on the test corpus.
